Quick Reference Guide
For use by clinicians

1. Check that you have the following parts:
   - 1 x Mattress (including top cover)
   - 1 x Squirrel Digital Pump 8535
   - 1 x User Manual
   - 1 x Standard Pump Hook (Pre attached to pump)
   - 1 x Extra Deep Pump Hook (for use with deep footboards)

2. Assemble the Mattress
   1) Attach the pump to the footboard of the bed. If the standard pump hooks are not deep enough to fit the footboard, please change to the second deeper version.
   2) Place the mattress base onto the bed frame, threading the tube set under the footboard. Make sure that the tube set does not impede moving parts.
   3) Ensure that the mattress top cover is fully zipped into place.
   4) Secure the Dormir mattress base on to the bed frame using the black nylon straps that are located on the base of the mattress. Ensure that the straps do not impede moving parts.
   5) Push the male tube set connector into the female port (situated at the side of the pump) until it clicks into place. To detach simply press the outside of the tube set connector and pull outwards. Never release the tube set connector whilst a patient is on the mattress.
   6) Check CPR Valve. Ensure that the CPR valve on the tube set is closed.
   7) Plug the pump into a power socket ensuring that electric cables are routed so they do not pose a trip hazard.

3. Using the Dormir Digital MRS
   1) Turn on the power at the wall socket, and the pump should begin to run automatically. Pressing the On/Off button on the pump will toggle the pump between On and Off states. The ‘On/Off’ light should illuminate when running.
   2) The Pump will now begin to inflate the Mattress; this initial inflation takes approximately 20 minutes. The Dormir Digital MRS is ready for use when the Normal LED is lit, and when the Low Pressure LED has gone out.
   3) The Dormir Digital pump is designed with a safe working patient weight range of 30Kg-150Kg in supine position. There is no weight guide/setting needed. Comfort setting: There is adjustment to make the mattress softer or firmer if the patient desires. Depending on physiology of the patient and the adjustment of the bed, the care team may want to manually adjust pump to a softer or firmer setting. The Comfort Level Indicator will indicate softer or firmer setting.
   4) To use Static Mode, press the Alternating/Static Mode button so that the ‘Static’ LED is illuminated. All the cells will inflate to the current comfort level, and alternation will stop. To exit Static mode, press the Static/Alternating mode button again. The Dormir Digital pump will automatically revert to Alternating mode after 20 minutes in Static mode.

Caution: This is a medical device and must be used in conjunction with sound clinical guidance. The full instruction manual must be read in full prior to use and consideration must be given to local policies. For assistance please call 0845 003 7979 / www.squirrelmedical.com.
